Wayne F. Schramm, Chief

* *

June 1988

ACKNOWLEDGEMENTS

Wayne Schramm, Chief, Bureau of Health Data Analysis, developed the basic methodology for the population estimates. Bruce Gibson, Research Analyst, wrote the computer program to estimate Missouri's population by age by sex by county, RPC using Lotus 1-2-3. Gail Baumhoer formatted the tables on the Macintosh computer and Carolyn McMillin prepared the report for publication.

Ryan Burson, from the Missouri Division of Budget and Planning, Office of Administration, in cooperation with the U.S. Bureau of the Census, provided most of the county and state control totals used to make these estimates.

Methodology of
Missouri Population Estimates
by County by Age by Sex

(1) Missouri Population Estimates by Age by Sex

Initially a cohort survival method is used to project the change in population from 1980 to 1985 with no migration assumed. Similarly population projections are made to 1990. Then these projections are interpolated back to 1981-1984 and 1986 and adjusted to Bureau of the Census state population age estimates consistent with those published in Current Population Reports, Series P-25.

(2) Missouri County Total Population Estimates

Estimates of total 1981-1986 populations for counties are revised figures to appear in an upcoming Current Population Reports P-26 report. The estimates apply to July 1 of each year, and are based on an average of two methods:

(a) A regression statistical procedure that gauges population change through such symptomatic indicators as school enrollments, motor vehicles, income tax returns, births, and Medicare enrollments; and

(b) An administrative records procedure that tracks population change through government-collected vital statistics, military and other group quarters populations, income tax and Medicare records.

(3) County Population Estimates by Age and Sex

The techniques used to estimate county populations in specific age groups are described below. With the exception of the under-5 age group, age estimates are disaggregated by sex according to the 1980 Census age-sex distribution. County estimates for each age group are adjusted to sum to an independently derived state age estimate.

(a) Under-5 Population

Total live births by county by sex in the five years prior to the estimate year are adjusted to the state under-5 age estimate.

(b) Under-18 Population

Estimates of the county populations under 18 years of age are computed using a procedure very similar to the Census Bureau's Component Method II. The procedure simply adds to the 1980 census count for those in the under-18 cohort in the estimate year the changes in the under-18 population due to births, deaths, and migration.[1] Data for resident births and deaths are collected by the Missouri Center for Health Statistics. Net migration for the under-18 cohort is developed from changes in elementary school enrollments reported by the Missouri Department of Elementary and Secondary Education since 1980, and from 1975-1980 net migration reported in the 1980 Census for the under-18 and school age groups.

(c) 5-17 Population

These estimates are obtained by subtracting the under-5 county estimates from the under-18 county estimates. The 5-14 and 15-17 county estimates are disaggregated on the basis of the independently derived state age estimate and the 1980 county age-sex distribution for these age groups.

(d) 65-and-Over Population

The method used to estimate county populations 65 years of age and over also comes from the Census Bureau's Component Method II. For each estimate year, the change in the number of enrollees in the federal Medicare program since the 1980 census date is added to the census population 65 years and over. Estimates for the 65-74, 75-84 and 85+ age groups are adjusted to reflect the 1980 age-sex distribution and the state age estimates for these groups.

(e) 18-64 Population

The 18-64 population estimates are calculated by taking the total county populations estimated in (2) and subtracting the county under-18 and 65-and-over populations. Estimates for the 18-19, 20-24, 25-34, 35-44, 45-54 and 55-64 age groups are adjusted to the 1980 age-sex distribution and the state age estimates for these groups.

(4) Regional Planning Commission (RPC), Health District Population Estimates

Population estimates for RPCs and health districts by age by sex are aggregations of the county age-sex population estimates.

NOTE:

[1] The under-18 cohort on July 1, 1984, for example, would include those under the exact age of 13.75 reported in the April 1, 1980 Census. Note that exactly 4.25 years separate the census and estimate dates. Since census data are reported only for complete single-year age groups, fractions are applied to the census counts to approximate the cohort population.

Appendix

Accuracy of the Population Estimate Methodology

Table A shows how accurate the methodology used in this publication was in estimating the 1980 population compared to the 1980 Census. 1970 was used as the base year in making these 1980 population estimates. The average difference between the estimates and the Census by age and county was 7.2 percent. The estimates by sex were further off, with male estimates being slightly less accurate than female estimates.

Generally, the estimates are more accurate for larger populations than smaller populations. The average age differential for RPCs was just 4.2 percent, and for health districts, it was only 3.1 percent.

The 1981 population estimates presented in this publication should probably be more accurate than those shown in Table A because they are closer to the base Census year. However, the further one gets away from the 1980 Census, the less accurate this methodology will be.

Table A

Percent Differences Between 1980 Population Estimates and 1980 Census by Age by Sex by County, RPC and Health District
